Data Wrangling and EDA, Part I

Exploratory Data Analysis and its role in the data science lifecycle

Pandas and Jupyter notebooks

Introduced to the DataFrame concept

Series: The column of data with "Label"

DataFrame: The collection of series with the same indices

DataFrame access methods

df. loc: location by index or labels

df. iloc: location by integer index

Filtering: slicing with boolean conditions

Utility func: size/shape, count_values(), unique ()

Groupby and pivot: for data aggregation or summarization

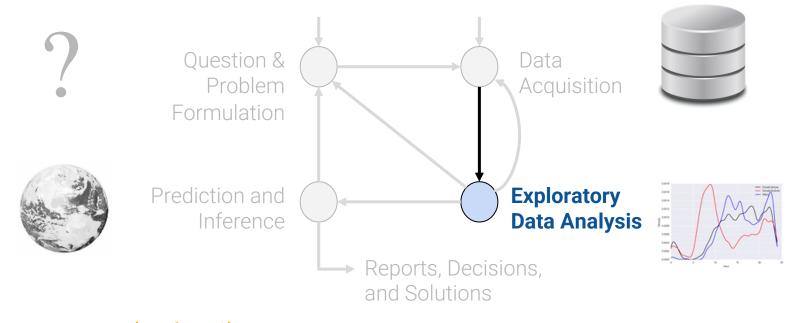

EDA Guiding Principles

The Next Step

Plan for First Few Weeks

(Weeks 1-2) (Week 3)

Exploring Tabular Data From datascience to pandas

Data Science in Practice

EDA, Data Cleaning, Text processing (regular expressions)

Basic Steps of EDA

Lecture 06

1. Understanding Data Structure:

Load the dataset and examine its shape, types, and structure (e.g., rows, columns, data types).

2. Descriptive Statistics:

Summarize data using measures like mean, median, mode, and standard deviation.

3. Data Cleaning:

Handle missing values, outliers, and duplicates.

4. Data Visualization:

Use plots (e.g., histograms, scatter plots, box plots) to explore distributions and relationships.

Basic Steps of EDA

Lecture 06

5. Feature Analysis:

Analyze correlations and interactions between variables.

6. Dimensionality Reduction (if needed):

Reduce dataset complexity while retaining essential information (e.g., PCA).

Structure: Tabular Data

Lecture 06

- Pandas, Part III
 - Groupby Review
 - More on Groupby
 - Pivot Tables
 - Joining Tables
- EDA, Part I
 - Structure: Tabular Data
 - Granularity
 - Structure: Variable Types

Structure -- the "shape" of a data file

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Temporality -- how is the data situated in time

Faithfulness -- how well does the data capture "reality"

Key Data Properties to Consider in EDA

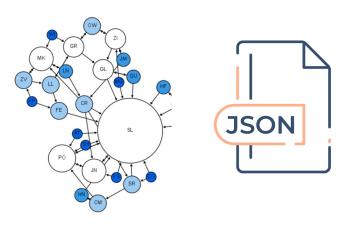

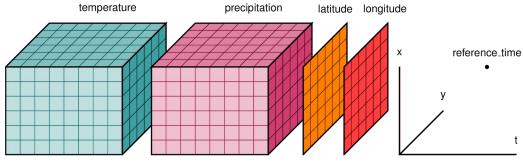

Rectangular and Non-rectangular Data

Data come in many different shapes.

Rectangular data temperature

Rectangular Data

We often prefer rectangular data for data analysis (why?)

- Regular structures are easy manipulate and analyze
- A big part of data cleaning is about transforming data to be more rectangular

Two kinds of rectangular data: **Tables** and **Matrices**.

Fields/Attributes/
Features/Columns

Tables (a.k.a. **DataFrame**s in R/Python and relations in SQL)

- Named columns with different types
- Manipulated using data transformation languages (map, filter, group by, join, ...)

Matrices

- Numeric data of the same type (float, int, etc.)
- Manipulated using linear algebra

Demo Slides

CSV: Comma-Separated Values

Tuberculosis in the US [CDC source].

CSV is a very common **tabular file format**.

- Records (rows) are delimited by a newline: '\n', "\r\n"
- Fields (columns) are delimited by commas: ', '

Pandas: pd.read_csv (header=...)

Fields/Attributes/Features/Columns

s/Rows		U.S. jurisdiction	TB cases 2019	
ords/	0	Total	8,900	
Reco	1	Alabama	87	

Granularity

Lecture 06

- Pandas, Part III
 - Groupby Review
 - More on Groupby
 - Pivot Tables
 - Joining Tables
- EDA, Part I
 - Structure: Tabular Data
 - Granularity
 - Structure: Variable Types

Key Data Properties to Consider in EDA

Structure -- the "shape" of a data file

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Temporality -- how is the data situated in time

Faithfulness -- how well does the data capture "reality"

Granularity: How Fine/Coarse Is Each Datum?

What does each **record** represent?

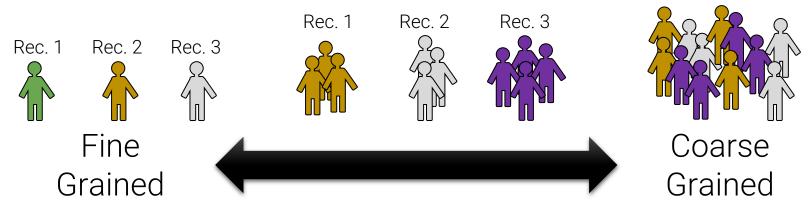

Examples: a purchase, a person, a group of users

Do all records capture granularity at the same level?

Some data will include summaries (aka rollups) as records.

If the data are **coarse**, how were the records aggregated?

Sampling, averaging, maybe some of both...

Rec. 1

Structure: Variable Types

Lecture 06

- Pandas, Part III
 - Groupby Review
 - More on Groupby
 - Pivot Tables
 - Joining Tables
- EDA, Part I
 - Structure: Tabular Data
 - Granularity
 - Structure: Variable Types

(we're back to this)

Variable Type

Structure -- the "shape" of a data file

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Temporality -- how is the data situated in time

Faithfulness -- how well does the data capture "reality"

Variables Are Columns

Let's look at records with the same granularity.

What does each **column** represent?

A **variable** is a **measurement** of a particular concept.

The U.S. Jurisdiction variable

	U.S. jurisdiction	TB cases 2019	
1	Alabama	87	
2	Alaska	58	

It has two common properties:

Datatype/Storage type:

How each variable value is stored in memory. df[colname].dtype

o integer, floating point, boolean, object (string-like), etc.

Affects which pandas functions you use.

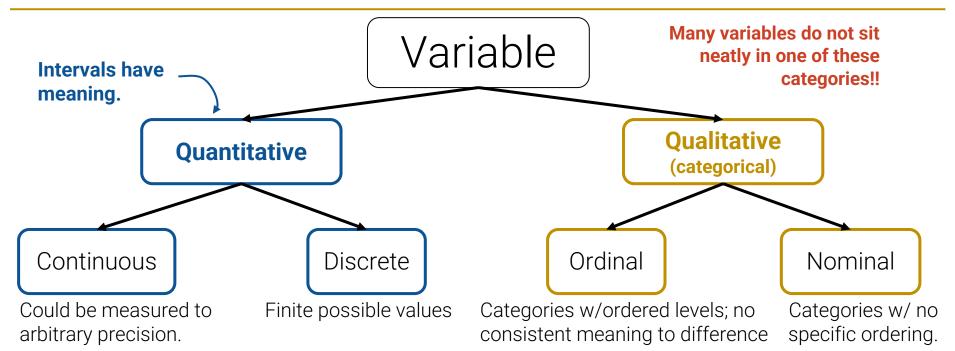

Variable type/Feature type:

Conceptualized measurement of information (and therefore what values it can take on).

- Use expert knowledge
- Explore data itself
- Consult data codebook (if it exists).

Affects how you visualize and interpret the data.

Variable Feature Types

Examples:

- Price
- Temperature

Examples:

- Number of siblings
- Yrs of education

Examples:

- Preferences
- Level of education

Examples:

- Political Affiliation
- Anger

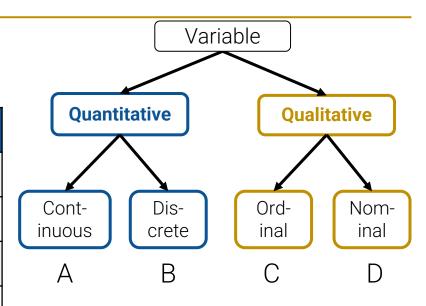

Note that **qualitative variables** could have numeric levels; conversely, **quantitative variables** could be stored as strings!

Variable Types

What is the feature type (i.e., variable type) of each variable?

Q	Variable	Feature Type
1	CO ₂ level (ppm)	
2	Number of siblings	
3	GPA	
4	Income bracket (low, med, high)	
5	Race/Ethnicity	
6	Number of years of education	
7	Yelp Rating	

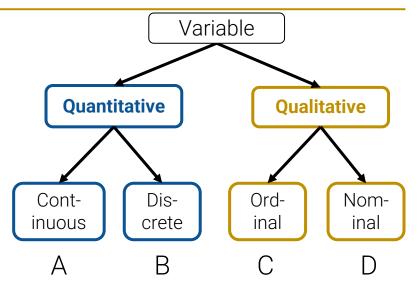

Variable Types

What is the feature type of each variable?

Q	Variable	Feature Type
1	CO ₂ level (ppm)	A. Quantitative Cont.
2	Number of siblings	B. Quantitative Discrete
3	GPA	A. Quantitative Cont.
4	Income bracket (low, med, high)	C. Qualitative Ordinal
5	Race/Ethnicity	D. Qualitative Nominal
6	Number of years of education	B. Quantitative Discrete
7	Yelp Rating	C. Qualitative Ordinal

Many of these examples show how "shaggy" these categories are!!
We will revisit variable types when we learn how to visualize variables.

LECTURE 6

Data Wrangling and EDA, Part II

Exploratory Data Analysis and its role in the data science lifecycle.

Data Science Fall 2023 @ Knowledge Stream

Today's Roadmap

Lecture 6

Structure

- Multiple Files
- More File Formats

Scope and Temporality

Faithfulness (and Missing Values)

Demo: Mauna Loa CO2

Tuberculosis - United States, 2021

Summary

What is already known about this topic?

The number of reported U.S. tuberculosis (TB) cases decreased sharply in 2020, possibly related to multiple factors associated with the COVID-19 pandemic.

What is added by this report?

Reported TB incidence (cases per 100,000 persons)

increased 9.4%, from 2.2 during 2020 to 2.4 during 2021 but was lower than incidence during 2019 (2.7). Increases

occurred among both U.S.-born and non–U.S.-born persons.

What are the implications for public health practice?

Factors contributing to changes in reported TB during 2020–2021 likely include an actual reduction in TB incidence as well as delayed or missed TB diagnoses. Timely evaluation and treatment of TB and latent tuberculosis infection remain critical to achieving U.S. TB elimination.

CDC Morbidity and Mortality Weekly Report (MMWR) 03/25/2022.

What is **incidence**? Why use it here?

How was "9.4% increase" computed?

Question: Can we **reproduce** these rates using government data?

What is incidence?

Summary

What is already known about this topic?

The number of reported U.S. tuberculosis (TB) cases decreased sharply in 2020, possibly related to multiple factors associated with the COVID-19 pandemic.

What is added by this report?

Reported TB incidence (cases per 100,000 persons)

increased 9.4%, from 2.2 during 2020 to 2.4 during 2021 but

was lower than incidence during 2019 (2.7). Increases occurred among both U.S.-born and non–U.S.-born persons.

What are the implications for public health practice?

Factors contributing to changes in reported TB during 2020–2021 likely include an actual reduction in TB incidence as well as delayed or missed TB diagnoses. Timely evaluation and treatment of TB and latent tuberculosis infection remain critical to achieving U.S. TB elimination.

CDC Morbidity and Mortality Weekly Report (MMWR) 03/25/2022.

What is **incidence**? Why use it here?

How was "9.4% increase" computed?

Question: Can we **reproduce** these rates using government data?

Defining incidence

From the <u>CDC report</u>: **TB incidence** is computed as the number of "cases per 100,000 persons using mid-year population estimates from the U.S. Census Bureau."

Incidence is useful when comparing case rates across differently sized populations.

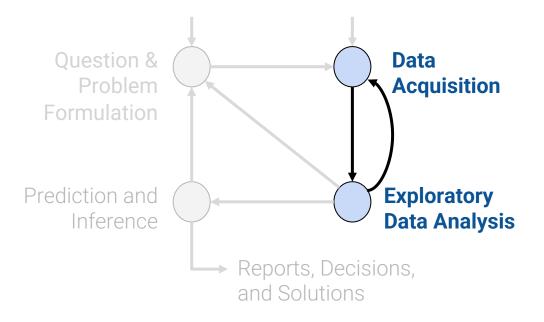

TB incidence =
$$\frac{\text{# TB cases in population}}{\text{# groups in population}}$$
 (group: 100,000 people)
$$= \frac{\text{# TB cases}}{\text{(population/100,000)}}$$
 =
$$\frac{\text{# TB cases}}{\text{population}}$$
 x 100,000 population

We don't have U.S. Census population data in our DataFrame.

We need to acquire it to verify incidence!

The Data Science Lifecycle is a Cycle

In practice, EDA informs whether you need more data to address your research question.

Structure: Primary Keys and Foreign Keys

Customers.csv

Sometimes your data comes in multiple files:

- Often data will reference other pieces of data.
- Alternatively, you will collect multiple pieces of related data.

Use pd.merge to join data on keys.

<u>CustID</u>	Addr	
171345	Harmon	
281139	Main	

Orders.csv

<u>OrderNum</u>	<u>CustID</u>	Date	
1	171345	8/21/2017	
2	281139	8/30/2017	

Products.csv

<u>ProdID</u>	Cost	
42	3.14	
999	2.72	

Purchases.csv

	•	
<u>OrderNum</u>	<u>ProdID</u>	Quantity
1	42	3
1	999	2
2	42	1

Structure: Primary Keys and Foreign Keys

Sometimes your data comes in multiple files:

- Often data will reference other pieces of data.
- Alternatively, you will collect multiple pieces of related data.

Use pd.merge to join data on **keys**.

Primary key: the column or set of columns in a table that *uniquely* determine the values in the remaining columns

- Primary keys are unique, but could be tuples.
- Examples: OrderNum, ProductIDs, ...

Primary Key

Primary Key	C	Customers.csv		
	<u>CustID</u>	Addr		
	171345	Harmon		
Primary Key	281139	Main		
\		Orders.csv		
<u>OrderNum</u>	<u>CustID</u>	Date		
1	171345	8/21/2017		
2	281139	8/30/2017		

Products.csv

<u>ProdID</u>	Cost	
42	3.14	
999	2.72	

Purchases.csv

OrderNum ProdID		Quantity
1	42	3
1	999	2
2	42	1

Structure: Primary Keys and Foreign Keys

Sometimes your data comes in multiple files:

- Often data will reference other pieces of data.
- Alternatively, you will collect multiple pieces of related data.

Use pd.merge to join data on keys.

Primary key: the column or set of columns in a table that determine the values of the remaining columns

- Primary keys are unique, but could be tuples.
- Examples: SSN, ProductIDs, ...

Foreign keys: the column or sets of columns that reference primary keys in other tables.

Primary Key 🔪		Customers.csv		
		<u>CustID</u>	Addr	
		171345	Harmon	
		281139	Main	
Foreign Key			Orders.csv	
<u>OrderNum</u>	Cu	<u>stID</u>	Date	
1	171345		8/21/2017	
2	281139		8/30/2017	

	Products.csv
ProdID	Cost
42	3.14
999	2.72
-	Purchases csv

	1	ar 01140C0.00 v
<u>OrderNum</u>	<u>ProdID</u>	Quantity

1	999	2
2	42	1

More Files Formats

Lecture 6

Structure

- Multiple Files
- More File Formats

Scope and Temporality

Faithfulness (and Missing Values)

Demo: Mauna Loa CO2

TSV: Tab Separated Values

Another common table file format.

- Records are delimited by a newline: '\n', "\r\n"
- **Fields** are delimited by '\t' (tab)

Demo Slides

Issues with CSVs and TSVs:

- Commas, tabs in records (use quotechar parameter)
- Quoting

Demo Slides

JSON: JavaScript Object Notation

Another file format.

- Very similar to Python dictionaries
- Strict formatting "quoting" addresses some issues in CSV/TSV
- Self-documenting: Can save metadata (data about the data) along with records in the same file

To reads JSON file: pd.read_json() function, which works for most simple JSON files.

We will dive deeper into exactly how a JSON can structured.

Demo Slides

JSON: JavaScript Object Notation

Berkeley covid cases by day (<u>City of Berkeley</u>)

A less common file format.

- Very similar to Python dictionaries
- Strict formatting "quoting" addresses some issues in CSV/TSV
- Self-documenting: Can save metadata (data about the data) along with records in the same file

Issues

- Not rectangular
- Each record can have different fields
- Nesting means records can contain tables complicated

Reading a JSON into pandas often requires some EDA.

Are the data in a standard format or encoding?

- Tabular data: CSV, TSV, Excel, SQL
- Nested data: JSON or XML

Are the data organized in **records** or nested?

- Can we define records by parsing the data?
- Can we reasonably un-nest the data?

Does the data reference other data?

- Can we join/merge the data?
- Do we need to?

What are the **fields** in each record?

- How are they encoded? (e.g., strings, numbers, binary, dates ...)
- What is the type of the data?

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Summary

You will do the most data wrangling when analyzing the structure of your data.

Scope and Temporality

Lecture 6

Structure

- Multiple Files
- More File Formats

Scope and Temporality

Faithfulness (and Missing Values)

Demo: Mauna Loa CO2

Key Data Properties to Consider in EDA

Structure -- the "shape" of a data file

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Temporality -- how is the data situated in time

Faithfulness -- how well does the data capture "reality"

Scope

Will my data be enough to answer my question?

- Example: I am interested in studying crime in California but I only have San Francisco crime data.
- **Solution**: collect more data/change research question

Is my data too expansive?

- Example: I am interested in student grades for DataScience but have student grades for all classes.
- Solution: Filtering ⇒ Implications on sample?
 - If the data is a sample I may have poor coverage after filtering

Does my data cover the right time frame?

Which brings us to Temporality

"Scope" questions are defined by your question/problem and inform if you need better-scoped data.

Temporality

Data changes – when was the data collected/last updated?

Periodicity — Is there periodicity? Diurnal (24-hr) patterns?

What is the meaning of the time and date fields? A few options:

- When the "event" happened?
- When the data was collected or was entered into the system?
- Date the data was copied into a database? (look for many matching timestamps)

Time depends on where! (time zones & daylight savings)

- Learn to use datetime Python library and Pandas dt accessors
- Regions have different datestring representations: 07/08/09?

Are there strange null values?

E.g., January 1st 1970, January 1st 1900...?

Faithfulness (and Missing Values)

Lecture 6

Structure

- Multiple Files
- More File Formats
- Scope and Temporality

Faithfulness (and Missing Values)

Structure -- the "shape" of a data file

Granularity -- how fine/coarse is each datum

Scope -- how (in)complete is the data

Temporality -- how is the data situated in time

Faithfulness -- how well does the data capture "reality"

Faithfulness: Do I trust this data?

Does my data contain **unrealistic or "incorrect" values**?

- Dates in the future for events in the past
- Locations that don't exist
- Negative counts
- Misspellings of names
- Large outliers

Does my data violate **obvious dependencies**?

E.g., age and birthday don't match

Was the data **entered by hand**?

- Spelling errors, fields shifted ...
- Did the form require all fields or provide default values?

Are there obvious signs of **data falsification**?

 Repeated names, fake looking email addresses, repeated use of uncommon names or fields.

Signs that your data may not be faithful (and proposed solutions)

Truncated data

Early Microsoft Excel limits: 65536 Rows, 255 Columns

Duplicated Records or Fields

Identify and eliminate (use primary key).

Spelling Errors

Apply corrections or drop records not in a dictionary

Units not specified or consistent

Infer units, check values are in reasonable ranges for data

Time Zone Inconsistencies

Convert to a common timezone (e.g., UTC)

- Be aware of consequences in analysis when using data with inconsistencies.
- Understand the potential implications for how data were collected.

Missing Data???

<u>Examples</u>

" " 1970, 0, -1 NaN 999, 12345 Null

NaN: "Not a Number"

1900

Missing Data/Default Values: Solutions

A. Drop records with missing values

- Probably most common
- Caution: check for biases induced by dropped values
 - Missing or corrupt records might be related to something of interest

B. Keep as NaN

C. Imputation/Interpolation: Inferring missing values

- Average Imputation: replace with an average value
 - Which average? Often use closest related subgroup mean.
- Hot deck imputation: replace with a random value
- Regression imputation: replace with a predicted value, using some model
- Multiple imputation: replace with multiple random values.

Missing Data/Default Values: Solutions

A. Drop records with missing values

- Probably most common
- Caution: check for biases induced by dropped values
 - Missing or corrupt records might be related to something of interest

B. Keep as NaN

C. Imputation/Interpolation: Inferring missing values

- Average Imputation: replace with an average value
 - Which average? Often use closest related subgroup mean.
- Hot deck imputation: replace with a random value
- Regression imputation: replace with a predicted value, using some model
- Multiple imputation: replace with multiple random values.

(beyond this course)

Choice affects bias and uncertainty quantification (large statistics literature)

Essential question: why are the records missing?

Summary: How do you do EDA/Data Wrangling?

Examine data and metadata:

What is the date, size, organization, and structure of the data?

Examine each **field/attribute/dimension** individually

Examine pairs of related dimensions

Stratifying earlier analysis: break down grades by major ...

Along the way:

- **Visualize**/summarize the data
- Validate assumptions about data and collection process. Pay particular attention to when data were collected.
- Identify and address anomalies
- Apply data transformations and corrections (next lecture)
- Record everything you do! (why?)
 - Developing in Jupyter Notebooks promotes reproducibility of your own work.
